AMENDMENT TO THE ABSTRACT

Please substitute the following for the Abstract:

A cutting device, particularly suited for removing vehicle glazing panels, has forward blade carrier and a rearward handle spaced from the forward blade carrier. The forward blade carrier may function as a handle, the device thereby being operable in two handed use. The rearward handle and forward blade carrier may be movable relative to one another permitting reconfiguration of the device. The rearward handle and forward blade carrier may be connected by a bridge portion. Novel aspects of the blade and lubrication for the device are also described and claimed.
